In today's society, most people have another "I". They may be different from themselves in a social state. People with social phobia are often hidden in our lives, but in many cases it is difficult for others to find out, and they will disguise themselves. Make yourself look very decent and generous in your daily life. However, some social activities and social distance can make them feel very uncomfortable.

I want to design a robot, it is our best friend. It is shy and slightly autistic. But it does not pretend to be itself. It can replace social fear patients and express their emotions intuitively.

When the player approaches with different distances and touches with different strengths, they interact with the robot. Will bring different changes to the robot. This reflects the psychologically comfortable distance and scale of the social phobia facing other people.

## Mindmap
